

My NASA Data - Mini Lesson/Activity

How Will Different Locations in the US Experience the 2024 Solar Eclipse?

The total solar eclipse path crosses from Mexico, through the United States from Texas to Maine, and up through Canada. Image Credit: ©2021 Great American Eclipse, LLC, Used with Permission.

Student Directions

Remember to never look directly at the Sun without proper safety equipment.

Use one of the following options for answering questions.

- How Will Different Locations on Earth Experience a Solar Eclipse? [Google Form](#)
- How Will Different Locations on Earth Experience a Solar Eclipse? [Google Doc](#)
- How Will Different Locations on Earth Experience a Solar Eclipse? [PDF](#)

A solar eclipse occurs when the Moon is between the Sun and Earth, and with the right conditions, the Moon casts a shadow on Earth's surface. The phenomenon of a solar eclipse is possible because even though the Sun is about 400 times larger than the Moon, the Sun is about 400 times farther away from Earth than the Moon is. This ratio of the size and distance of these objects makes them appear the same size in the sky.

The Moon is a little over 25% the size of Earth. Therefore, during a solar eclipse, the shadow of the Moon only covers a small portion of Earth. We call the path of the Moon's shadow, as it moves across Earth, the "path of totality."

During a solar eclipse, people in locations in the path of totality can experience 2-4 minutes when the shadow completely blocks out the light from the Sun. The length of time may not be the same for every location. We call this a total solar eclipse. This is the only time when viewers can remove their solar eclipse glasses.

During the total solar eclipse, the Sun's corona is shown as a crown of white flares from the surface. Image credit: NASA Photo / Carla Thomas

<https://my NASA data.larc.nasa.gov/sites/default/files/inline-images/Total%20Eclipse.png>

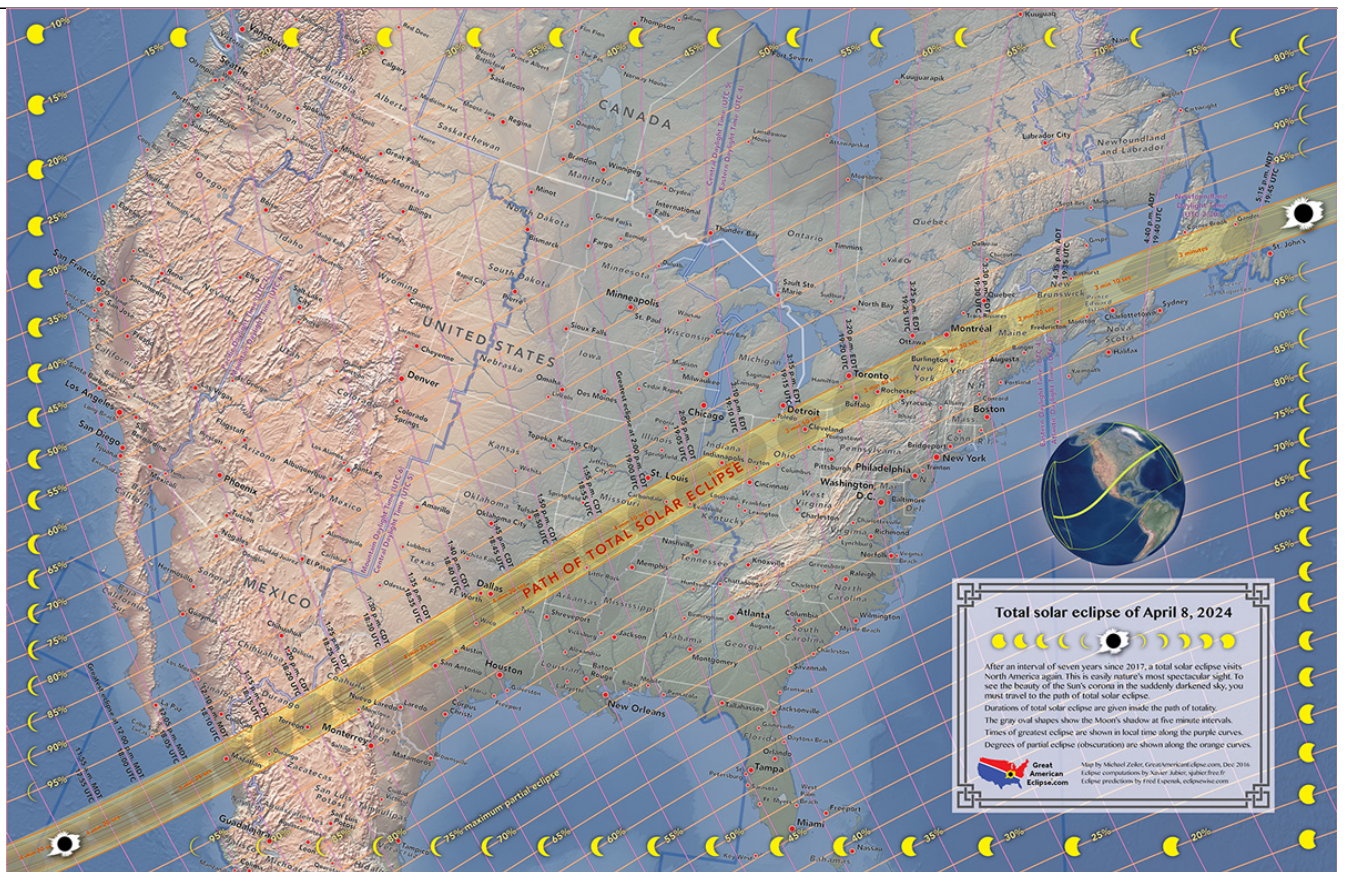

People who are outside the path of totality, will see a partial solar eclipse, where only part of the Moon's shadow covers the Sun. Solar eclipse glasses are needed to view a partial solar eclipse. People in different locations will experience different percentages of coverage of the Sun by the Moon's shadow, as seen in the figure below.

[The Sun appears partially eclipsed in this series of photos taken from NASA's Johnson Space Center in Houston on August 21, 2017. Steps:

1. Examine the map of the United States that shows how each location will experience the April 8, 2024 solar eclipse.

[The path of the eclipse continues from Mexico, entering the United States in Texas, and traveling through Oklahoma, Arkansas, Missouri, Illinois, Kentucky, Indiana, Ohio, Pennsylvania, New York, Vermont, New Hampshire, and Maine., Image Credit: copyright 2021 Great American Eclipse, LLC, Used with Permission., https://solarsystem.nasa.gov/eclipses/2024/apr-8-total/where-when/](https://solarsystem.nasa.gov/eclipses/2024/apr-8-total/where-when/)

Map Key:

- The dark paths across the map are where the largest area of the Sun will be covered by the Moon. People in these paths will experience either an annular or total solar eclipse. For a total solar eclipse, the ovals are called the umbra and create the path of totality.
 - On the map, the ovals contain times inside corresponding to the shape of the Moon's shadow cast at that time during the eclipse.
 - Also within the dark paths are duration contours. These delineate the length of time annularity or totality will last. The closer to the center of the solar eclipse path, the longer it will last. For the total path, times range up to 4 minutes.
 - Outside the eclipse paths, the map displays contours of obscuration, or percentage of the Sun's area covered by the Moon. Readers can trace the lines printed along the left and top of map for the 2023 annular solar eclipse and along the right and bottom for the 2024 total solar eclipse. Notice how the 2024 total solar eclipse has a higher maximum percentage because the Moon will completely cover the Sun's surface.
2. Examine the data table that accompanies the data from the map. For example, if you live in Dallas, TX:
- The **partial eclipse begins** at **12:23 pm** Central Daylight Time (CDT). The Moon's shadow will start to cover the Sun.

-
- The Sun will become more and more obscured until **totality begins** at **1:40 pm** CDT.
 - As you experience totality, the sky gets darker and darker until **1:42 pm** CDT, at the **maximum totality**, which is the moment that you would experience the most darkness.
 - **Totality ends** at **1:44 pm** CDT, when the Moon's shadow moves away from you.
 - You would then experience a partial solar eclipse until the **partial ends** **3:02 pm** CDT.
-
- **Safety Reminder!** Only viewers in the path of totality will be able to remove their solar eclipse glasses, and only during totality, which only lasts for about 4 minutes in most locations. The rest of the time observers will have to wear their solar eclipse glasses to view the partial eclipse.

Location	Partial Begins	Totality Begins	Maximum	Totality Ends	Partial Ends
Dallas, Texas	12:23 p.m. CDT	1:40 p.m. CDT	1:42 p.m. CDT	1:44 p.m. CDT	3:02 p.m. CDT
Idabel, Oklahoma	12:28 p.m. CDT	1:45 p.m. CDT	1:47 p.m. MDT	10:49 p.m. MDT	3:06 p.m. CDT
Little Rock, Arkansas	12:33 p.m. CDT	1:51 p.m. CDT	1:52 p.m. CDT	1:54 p.m. CDT	3:11 p.m. CDT
Poplar Bluff, Missouri	12:39 p.m. CDT	1:56 p.m. CDT	1:56 p.m. CDT	2:00 p.m. CDT	3:15 p.m. CDT
Paducah, Kentucky	12:42 p.m. CDT	2:00 p.m. CDT	2:01 p.m. CDT	2:02 p.m. CDT	3:18 p.m. CDT
Evansville, Indiana	12:45 p.m. CDT	2:02 p.m. CDT	2:04 p.m. CDT	2:05 p.m. CDT	3:20 p.m. CDT
Cleveland, Ohio	1:59 p.m. EDT	3:13 p.m. EDT	3:15 p.m. EDT	3:17 p.m. EDT	4:29 p.m. EDT
Erie, Pennsylvania	2:02 p.m. EDT	3:16 p.m. EDT	3:18 p.m. EDT	3:20 p.m. EDT	4:30 p.m. EDT
Buffalo, New York	2:04 p.m. EDT	3:18 p.m. EDT	3:20 p.m. EDT	3:22 p.m. EDT	4:32 p.m. EDT
Burlington, Vermont	2:14 p.m. EDT	3:26 p.m. EDT	3:27 p.m. EDT	3:29 p.m. EDT	4:37 p.m. EDT
Lancaster, New Hampshire	2:16 p.m. EDT	3:27 p.m. EDT	3:29 p.m. EDT	3:30 p.m. EDT	4:38 p.m. EDT
Caribou, Maine	2:22 p.m. EDT	3:32 p.m. EDT	3:33 p.m. EDT	3:34 p.m. EDT	4:40 p.m. EDT

[Eclipse Timetable, Credit: NASA Solar System Exploration, Our Galactic Neighborhood, https://my.nasadata.larc.nasa.gov/sites/default/files/inline-images/eclipse%20timetable.png](https://my.nasadata.larc.nasa.gov/sites/default/files/inline-images/eclipse%20timetable.png)

3. Answer the following questions.

1. What location on the path of totality will experience the longest duration of totality?
2. What location on the path of totality will experience the shortest duration of totality?
3. Where is your location? What will you see at that location on April 8, 2024? For how long will you be able to see it?
4. Make a prediction: how does NASA predict the duration of totality in different locations for future solar eclipses?

4. Watch this [video](#) on *Tracing the 2017 Solar Eclipse* to learn more about how NASA uses data from past eclipses to predict the locations and times of future solar eclipses.

1. Answer the following questions about the video.
 1. What features of this visualization are driven by data?
 2. How does Moon topography (mountains and valleys) affect the duration of totality?
 3. What other variables affect the way an observer views a total solar eclipse from different locations on Earth?

This product is supported by the NASA Heliophysics Education Activation Team (NASA HEAT), part of NASA's Science Activation portfolio.

The length of totality also depends on where on the planet's surface the shadow falls (elevation), how far away the Moon is from Earth, and how far Earth is from the Sun at that time. Both the speed of the Moon in its orbit around Earth, and the speed of the Earth around the Sun, cause the shadow to move across the Earth at different rates. The shape of the orbits of both the Earth and the Moon are elliptical, not circular, causing the speed of the object to change depending on where it is in its orbit. Planetary bodies speed up when they are closer to the object they are orbiting (Kepler's Laws of Planetary Motion). The speed at which Earth is rotating also affects how the shadow moves across the Earth.
